

EPA Region 8

FOIA 001392

As requested in the FOIA request, EPA Region 8 extracted data from the Safe Drinking Water Information System – State (SDWIS) database for Wyoming water systems for the following data fields: water system name and identification number, facility, sample point, contact, and analyte group. EPA loaded the extract into a Microsoft Access database, into tables of the same SDWIS table names. The sample and sample results for the requested analytes (TTHM, HAA5, bromate, chlorite, TTHM species, HAA5 species, TOC, alkalinity) were also extracted from SDWIS and loaded into the Access tables. The data set included all data in EPA's database for the requested information, without setting a specific beginning date for the data. EPA created a query in the Access database to extract the sample results for all of the analytes that were loaded.

EPA compressed the Access database (named RT_Wyoming_EPA_Region8_FOIA 001392.mdb). EPA also copied the SDWIS data dictionary, SDWIS_30_DD.mdb into the zip file, per the FOIA request. EPA uploaded the zipped file to the Corona Environmental Consulting account on the Filemail.com web service, where the requestor could then modify the query to extract information according to their exact requirements. EPA received confirmation that the requestor received the database from that site.
